Outline

1. What is Python?
2. How Python Works
3. History of Python
4. Guido van Rossum's Philosophy

Outline

1. What is Python?
2. How Python Works
3. History of Python
4. Guido van Rossum's Philosophy

1. What is Python?

- High-level, dynamically-typed, interpreted programming language
- Created by Guido van Rossum in 1991
- Designed to be easy to read and write
- Versatile: web, data science, automation, AI, etc.
- Open-source and free
- Named after “Monty Python’s Flying Circus”

Outline

1. What is Python?
- 2. How Python Works**
3. History of Python
4. Guido van Rossum's Philosophy

2.1 Interpreted Language

The Execution Process:

1. **Writing the Code** — Create a .py file
2. **Parsing** — Interpreter reads your code
3. **Compilation to Bytecode** — Source code converted to bytecode
4. **Bytecode Execution** — Python Virtual Machine executes bytecode

2.2 Interpreted vs Compiled Languages

Compiled (C, C++)

- Fast execution
- Compiled once
- Errors at compile time
- Platform-specific
- Slower development

Interpreted (Python)

- Slower execution
- Compiled at runtime
- Errors at runtime
- Cross-platform
- Faster development

2.3 Python's Virtual Machine (PVM)

The **Python Virtual Machine** is an abstract computing machine that executes Python bytecode.

It's the layer between your code and the actual computer hardware.

This design enables:

- **Development Speed** — No compilation step needed
- **Cross-Platform** — Same code runs everywhere
- **Portability** — Windows, Mac, Linux without changes

Outline

1. What is Python?
2. How Python Works
- 3. History of Python**
4. Guido van Rossum's Philosophy

3.1 Historical Timeline

1989 → Guido van Rossum creates Python at CWI (Amsterdam) starts development

1991 → Python 0.9 released

1994 → Python 1.0 (first stable)

2000 → Python 2.0 (industry standard)

2008 → Python 3.0 (breaking change)

2010s → Python 2 vs 3 war

2020 → Python 2 officially ends

2024 → Python 3.12+ (modern, fast)

3.2 Python Implementations

Different implementations of the Python language:

- **CPython** — Most common (written in C)
- **PyPy** — Faster with JIT compilation
- **Jython** — Runs on Java Virtual Machine
- **IronPython** — Runs on .NET

3.3 Why Python Exploded in Popularity

1. **Data Science Boom** — NumPy, Pandas, Scikit-learn
2. **AI/Machine Learning** — TensorFlow, PyTorch, default choice
3. **Simple Syntax** — Perfect for teaching
4. **Web Development** — Django, Flask frameworks
5. **Automation** — DevOps and scripting
6. **Community** — Stack Overflow, GitHub, Reddit

3.4 Adoption Milestones

- **1994-2000** — System administration and scripting
- **2006-2010** — Data science libraries emerge
- **2010-2015** — Machine learning revolution
- **2015+** — 1 language for AI/ML
- **2020+** — Surpasses Java in popularity

3.5 Current State (2024)

Python is now:

- **1–2 most popular language** (competing with JavaScript)
- **Default for data science, AI, and ML**
- **Growing in web development** (FastAPI, etc.)
- **Essential in education** — taught worldwide
- **Industry standard** for automation and DevOps

Outline

1. What is Python?
2. How Python Works
3. History of Python
- 4. Guido van Rossum's Philosophy**

4. Guido van Rossum's Philosophy

The “Zen of Python” (PEP 20) summarizes the language:

Beautiful is better than ugly

Explicit is better than implicit

Simple is better than complex

Readability counts

This philosophy has guided Python for 30+ years and explains its success.
