

Python Programming Fundamentals

Exception Handling

Programming Fundamentals Team

SETU

2026-06-12

Outline

1. What are Exceptions?
2. `try / except`
3. `else and finally`
4. Common Python Exceptions
5. Capturing the Exception Object
6. Raising Exceptions
7. Custom Exceptions
8. Exception Hierarchy

Outline

1. What are Exceptions?
2. try / except
3. else and finally
4. Common Python Exceptions
5. Capturing the Exception Object
6. Raising Exceptions
7. Custom Exceptions
8. Exception Hierarchy

1.1 Errors that happen at runtime

```
int("hello")           # ValueError
10 / 0                  # ZeroDivisionError
my_list[100]            # IndexError
my_dict["key"]          # KeyError
open("missing.txt")    # FileNotFoundError
```

Without handling: the program **crashes** with a traceback.

With handling: the program **recovers** gracefully and continues (or exits cleanly).

Outline

1. What are Exceptions?
- 2. try / except**
3. else and finally
4. Common Python Exceptions
5. Capturing the Exception Object
6. Raising Exceptions
7. Custom Exceptions
8. Exception Hierarchy

2. try / except

```
try:
    value = int(input("Enter a number: "))
    result = 100 / value
    print(f"100 / {value} = {result}")
except ValueError:
    print("That was not a valid integer!")
except ZeroDivisionError:
    print("Cannot divide by zero!")
```

- The try block contains code that **might** raise an exception
- Each except block handles a **specific** exception type
- If no exception: except blocks are skipped

Outline

1. What are Exceptions?
2. try / except
3. **else and finally**
4. Common Python Exceptions
5. Capturing the Exception Object
6. Raising Exceptions
7. Custom Exceptions
8. Exception Hierarchy

3. else and finally

```
try:
    f = open("data.txt", "r")
    content = f.read()
except FileNotFoundError:
    print("File not found!")
    content = ""
else:
    # Runs only if try succeeded (no exception)
    print(f"Read {len(content)} characters")
finally:
    # ALWAYS runs – exception or not
    print("Done attempting to read file.")
    # good place to close resources
```

Outline

1. What are Exceptions?
2. try / except
3. else and finally
- 4. Common Python Exceptions**
5. Capturing the Exception Object
6. Raising Exceptions
7. Custom Exceptions
8. Exception Hierarchy

4. Common Python Exceptions

Exception	When raised
ValueError	Wrong value type/range (e.g. <code>int("abc")</code>)
TypeError	Wrong type in operation
IndexError	List index out of range
KeyError	Dict key not found
FileNotFoundError	File does not exist
ZeroDivisionError	Division by zero
AttributeError	Object has no such attribute
NameError	Variable not defined

Outline

1. What are Exceptions?
2. try / except
3. else and finally
4. Common Python Exceptions
- 5. Capturing the Exception Object**
6. Raising Exceptions
7. Custom Exceptions
8. Exception Hierarchy

5. Capturing the Exception Object

```
try:
    product = Product("Apple", -5.0, 101)
except ValueError as e:
    print(f"Could not create product: {e}")
# Output: Could not create product: Price must be > 0
```

Multiple except, one handler

```
try:
    data = process_input(raw)
except (ValueError, TypeError) as e:
    print(f"Bad input: {e}")
```

Outline

1. What are Exceptions?
2. try / except
3. else and finally
4. Common Python Exceptions
5. Capturing the Exception Object
- 6. Raising Exceptions**
7. Custom Exceptions
8. Exception Hierarchy

6.1 Signal errors from your code

```
def set_price(self, price: float):  
    if price <= 0:  
        raise ValueError(f"Price must be > 0, got {price}")  
    self.__price = price  
  
def find_by_id(self, pid: int):  
    for p in self.__products:  
        if p.get_product_id() == pid:  
            return p  
    raise KeyError(f"No product with ID {pid}")
```

Use raise to push the problem **up to the caller**, who may be able to handle it better.

Outline

1. What are Exceptions?
2. try / except
3. else and finally
4. Common Python Exceptions
5. Capturing the Exception Object
6. Raising Exceptions
- 7. Custom Exceptions**
8. Exception Hierarchy

7. Custom Exceptions

```
class ShopError(Exception):
    """Base exception for Shop application."""
    pass

class DuplicateProductError(ShopError):
    def __init__(self, product_id: int):
        super().__init__(
            f"Product with ID {product_id} already exists"
        )
        self.product_id = product_id

class ProductNotFoundError(ShopError):
    def __init__(self, name: str):
        super().__init__(f"Product '{name}' not found")
        self.name = name
```

7. Custom Exceptions

```
# Usage  
raise DuplicateProductError(101)
```

Outline

1. What are Exceptions?
2. try / except
3. else and finally
4. Common Python Exceptions
5. Capturing the Exception Object
6. Raising Exceptions
7. Custom Exceptions
- 8. Exception Hierarchy**

8. Exception Hierarchy

BaseException

└─ Exception

├─ ValueError

├─ TypeError

├─ IndexError

├─ KeyError

├─ FileNotFoundError (subclass of OSError)

└─ ... (your custom exceptions here)

Catching a **parent** class catches all its subclasses:

```
except Exception as e:    # catches almost everything
    print(f"Unexpected error: {e}")
```

Thanks for Watching - Any questions?
