Outline

1. Iterating Over Lists
2. `enumerate()` with Lists
3. Finding Min and Max Manually
4. Filtering a List
5. List Comprehensions
6. While Loops with Lists
7. Practical — Statistics on a List

Outline

- 1. Iterating Over Lists**
2. enumerate() with Lists
3. Finding Min and Max Manually
4. Filtering a List
5. List Comprehensions
6. While Loops with Lists
7. Practical — Statistics on a List

1. Iterating Over Lists

The for loop is the natural way to process every item in a list.

```
temperatures = [15.2, 18.7, 12.4, 22.1, 19.8]
```

```
# Print each temperature
```

```
for temp in temperatures:  
    print(f"{temp:.1f}C")
```

```
# Accumulation – find total
```

```
total = 0
```

```
for temp in temperatures:  
    total += temp
```

```
average = total / len(temperatures)
```

```
print(f"Average: {average:.1f}C")
```

1. Iterating Over Lists

1. Iterating Over Lists

The for loop is the natural way to process every item in a list.

```
temperatures = [15.2, 18.7, 12.4, 22.1, 19.8]
```

```
# Print each temperature
for temp in temperatures:
    print(f"{temp:.1f}C")
```

```
# Accumulation – find total
total = 0
for temp in temperatures:
    total += temp
average = total / len(temperatures)
print(f"Average: {average:.1f}C")
```

Python also has built-in functions for common operations:

1. Iterating Over Lists

```
print(sum(temperatures))    # total
print(min(temperatures))    # lowest
print(max(temperatures))    # highest
```

Outline

1. Iterating Over Lists
- 2. enumerate() with Lists**
3. Finding Min and Max Manually
4. Filtering a List
5. List Comprehensions
6. While Loops with Lists
7. Practical — Statistics on a List

2. enumerate() with Lists

enumerate() gives both the **index** and the **value**.

```
students = ["Alice", "Bob", "Carol", "Dave"]
```

```
for i, student in enumerate(students):  
    print(f"Student {i}: {student}")
```

```
# Start numbering from 1
```

```
for i, student in enumerate(students, start=1):  
    print(f"{i}. {student}")
```

2. enumerate() with Lists

2. enumerate() with Lists

enumerate() gives both the **index** and the **value**.

```
students = ["Alice", "Bob", "Carol", "Dave"]
```

```
for i, student in enumerate(students):  
    print(f"Student {i}: {student}")
```

```
# Start numbering from 1
```

```
for i, student in enumerate(students, start=1):  
    print(f"{i}. {student}")
```

Updating items using index:

```
scores = [72, 85, 91, 64, 78]
```

```
# Add 5 bonus points to each score
```

```
for i in range(len(scores)):
```

2. enumerate() with Lists

```
scores[i] += 5  
  
print(scores)    # [77, 90, 96, 69, 83]
```

Outline

1. Iterating Over Lists
2. enumerate() with Lists
- 3. Finding Min and Max Manually**
4. Filtering a List
5. List Comprehensions
6. While Loops with Lists
7. Practical — Statistics on a List

3. Finding Min and Max Manually

Useful to understand the algorithm, even though Python has built-ins.

```
def find_min(numbers):  
    """Return the smallest number in a non-empty list."""  
    smallest = numbers[0]  
    for num in numbers[1:]:  
        if num < smallest:  
            smallest = num  
    return smallest  
  
def find_max_index(numbers):  
    """Return the INDEX of the largest number."""  
    max_idx = 0  
    for i in range(1, len(numbers)):  
        if numbers[i] > numbers[max_idx]:  
            max_idx = i
```

3. Finding Min and Max Manually

```
    return max_idx
```

```
data = [34, 12, 78, 45, 23, 91, 56]
print(find_min(data))           # 12
print(find_max_index(data))     # 5
print(data[find_max_index(data)]) # 91
```

Outline

1. Iterating Over Lists
2. enumerate() with Lists
3. Finding Min and Max Manually
- 4. Filtering a List**
5. List Comprehensions
6. While Loops with Lists
7. Practical — Statistics on a List

4. Filtering a List

Manual filter — build a new list with only matching items:

```
scores = [45, 72, 88, 53, 91, 64, 78, 39, 85]
```

```
passing = []
for score in scores:
    if score >= 60:
        passing.append(score)

print(f"Passing scores: {passing}")
print(f"Pass rate: {len(passing)/len(scores):.0%}")
```

4. Filtering a List

4. Filtering a List

Manual filter — build a new list with only matching items:

```
scores = [45, 72, 88, 53, 91, 64, 78, 39, 85]
```

```
passing = []
for score in scores:
    if score >= 60:
        passing.append(score)

print(f"Passing scores: {passing}")
print(f"Pass rate: {len(passing)/len(scores):.0%}")
```

Using the built-in filter() function:

```
passing = list(filter(lambda s: s >= 60, scores))
```

Or a list comprehension (most Pythonic):

4. Filtering a List

```
passing = [s for s in scores if s >= 60]
```

Outline

1. Iterating Over Lists
2. enumerate() with Lists
3. Finding Min and Max Manually
4. Filtering a List
- 5. List Comprehensions**
6. While Loops with Lists
7. Practical — Statistics on a List

5. List Comprehensions

A compact way to build a new list from an existing one.

```
# Traditional for loop
```

```
squares = []
```

```
for x in range(1, 8):  
    squares.append(x ** 2)
```

```
# Equivalent list comprehension
```

```
squares = [x ** 2 for x in range(1, 8)]
```

```
print(squares)    # [1, 4, 9, 16, 25, 36, 49]
```

5. List Comprehensions

5. List Comprehensions

A compact way to build a new list from an existing one.

```
# Traditional for loop
```

```
squares = []  
for x in range(1, 8):  
    squares.append(x ** 2)
```

```
# Equivalent list comprehension
```

```
squares = [x ** 2 for x in range(1, 8)]  
print(squares)    # [1, 4, 9, 16, 25, 36, 49]
```

With a condition:

```
numbers = [-3, 5, -1, 8, -4, 2, 7]  
positives = [n for n in numbers if n > 0]  
print(positives)    # [5, 8, 2, 7]
```

5. List Comprehensions

```
# Transform strings
names = ["  alice  ", "BOB", "Carol"]
cleaned = [n.strip().title() for n in names]
print(cleaned)    # ['Alice', 'Bob', 'Carol']
```

Outline

1. Iterating Over Lists
2. enumerate() with Lists
3. Finding Min and Max Manually
4. Filtering a List
5. List Comprehensions
- 6. While Loops with Lists**
7. Practical — Statistics on a List

6. While Loops with Lists

```
# Process items until the list is empty
queue = ["Alice", "Bob", "Carol"]

while queue:                # True while list is non-empty
    next_person = queue.pop(0)
    print(f"Serving: {next_person}")

print("All done!")
```

6. While Loops with Lists

6. While Loops with Lists

```
# Process items until the list is empty
queue = ["Alice", "Bob", "Carol"]

while queue:                # True while list is non-empty
    next_person = queue.pop(0)
    print(f"Serving: {next_person}")

print("All done!")

# Collect until sentinel
numbers = []
print("Enter numbers (0 to stop):")
while True:
    value = float(input("> "))
    if value == 0:
        break
```

6. While Loops with Lists

```
numbers.append(value)
```

```
if numbers:  
    print(f"Count:    {len(numbers)}")  
    print(f"Sum:      {sum(numbers):.2f}")  
    print(f"Average:  {sum(numbers)/len(numbers):.2f}")
```

Outline

1. Iterating Over Lists
2. enumerate() with Lists
3. Finding Min and Max Manually
4. Filtering a List
5. List Comprehensions
6. While Loops with Lists
- 7. Practical — Statistics on a List**

7. Practical — Statistics on a List

```
def analyse(data):  
    """Return a dict of statistics for a numeric list."""  
    if not data:  
        return {}  
    sorted_data = sorted(data)  
    n = len(sorted_data)  
    return {  
        "count": n,  
        "sum": sum(sorted_data),  
        "min": sorted_data[0],  
        "max": sorted_data[-1],  
        "mean": sum(sorted_data) / n,  
        "median": sorted_data[n // 2] if n % 2 != 0  
                   else (sorted_data[n//2-1] + sorted_data[n//2]) / 2,  
    }
```

7. Practical — Statistics on a List

```
scores = [78, 92, 85, 71, 88, 95, 64, 82, 90, 77]
stats = analyse(scores)
for key, value in stats.items():
    if isinstance(value, float):
        print(f" {key:<8}: {value:.2f}")
    else:
        print(f" {key:<8}: {value}")
```

Thanks for Watching - Any questions?
